

Question: which countries are on the top in each status category? (Imprisoned, Missing and killed)

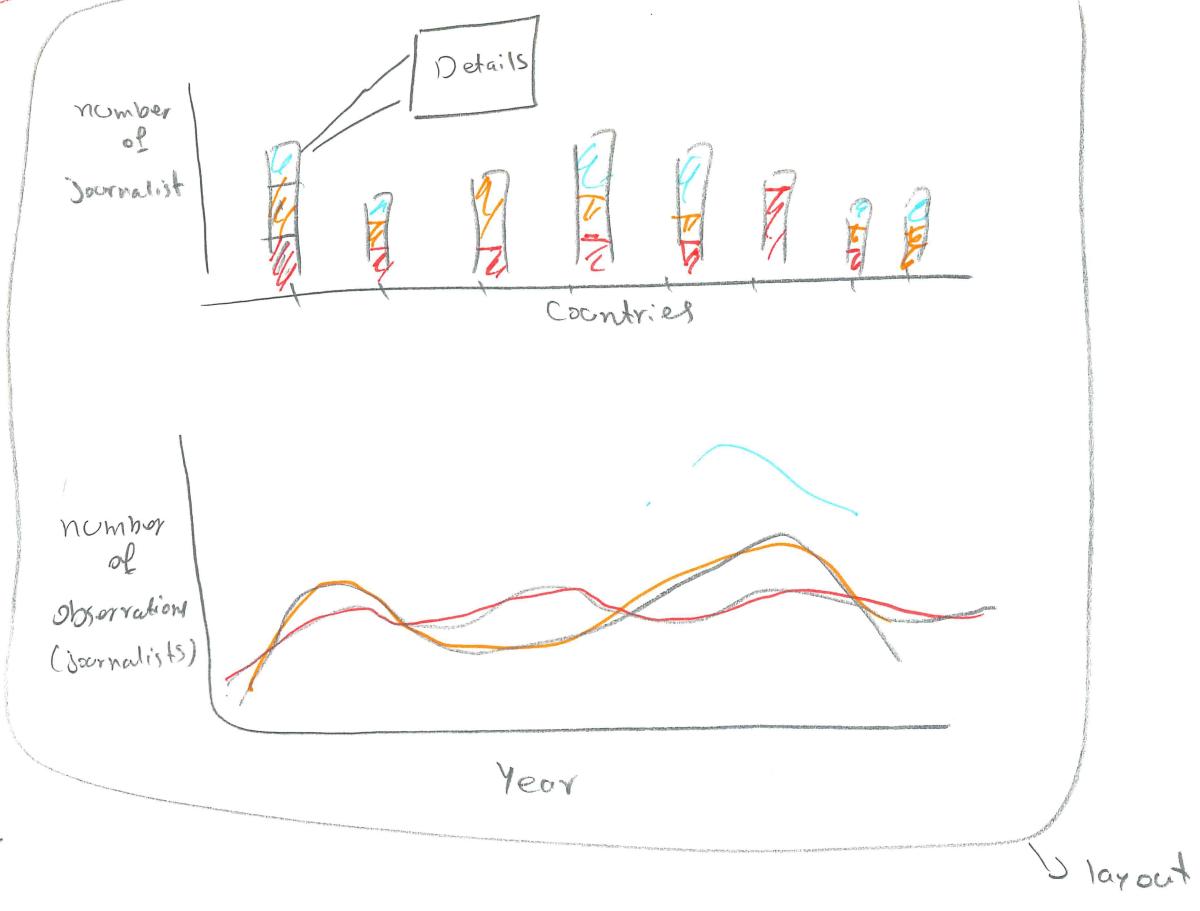

This idea does not seem to be practical as I tried to implement it but due to high number of observations the year attribute will be very unclear. Even though I created another attribute called region and added to the data set. (Implementation in Tableau didn't work very well)

another idea:

Top countries?

Quick Discussion

↳ layout

- Sorting the bar chart, to get top countries can't really have meaningful interaction with year.

To do:

- Need to find a better way of interaction
- Decide on which attributes can work better in order to achieve answering the main question
- Maybe using 3 sheets in one dashboard? (checked on next day but screen will be so full)

↳ No

Possible conclusion:

- mixing the two ideas →

using map from first idea
AND

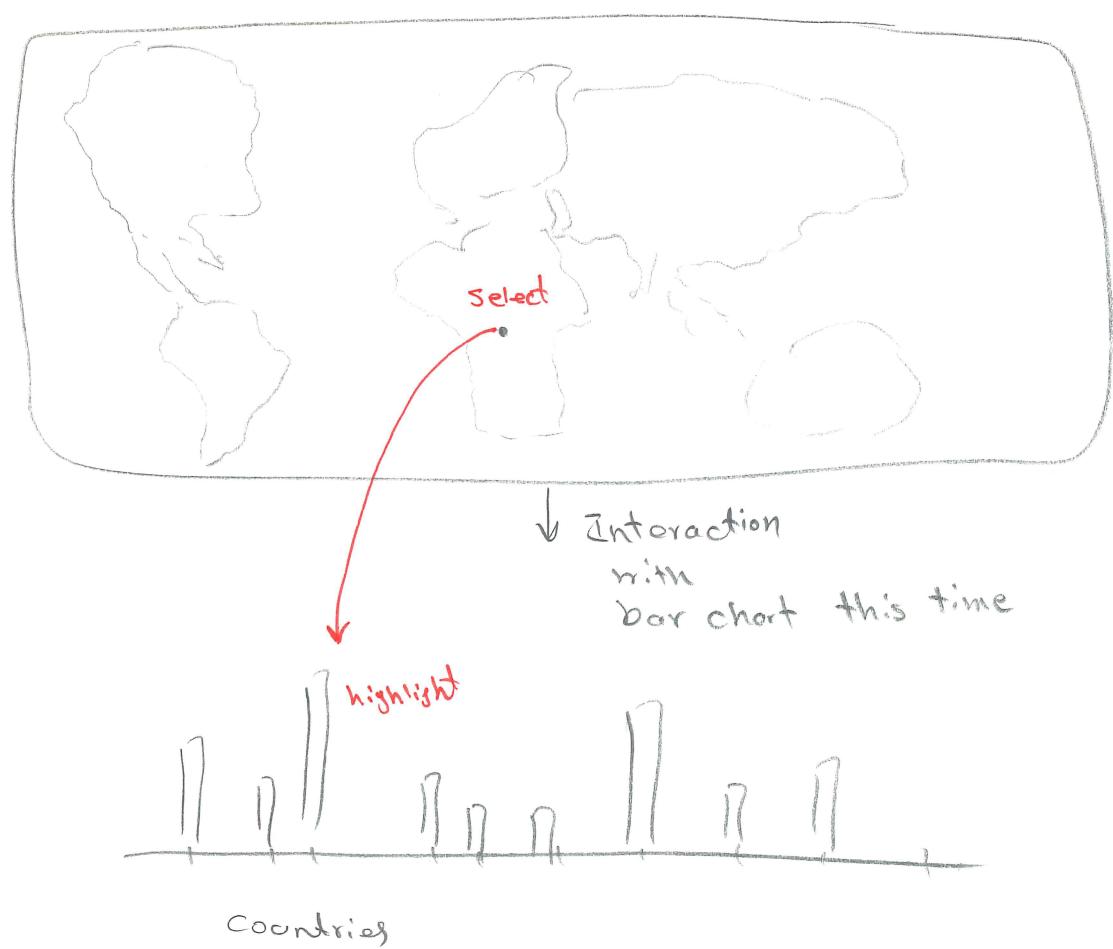

Bar chart from the
second idea

Tomorrow
create
this on a
new dashboard

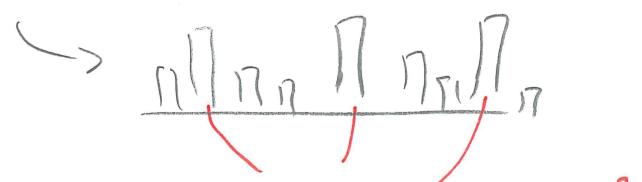

②

~~3rd and 4th~~ Attempt:

Question: which countries are on the top in each status category? (Imprisoned, missing and killed)

In this process user might not be able to distinguish which countries are on top of the list by just looking at bar chart. i.e

what is the
solution?

and in what
status?

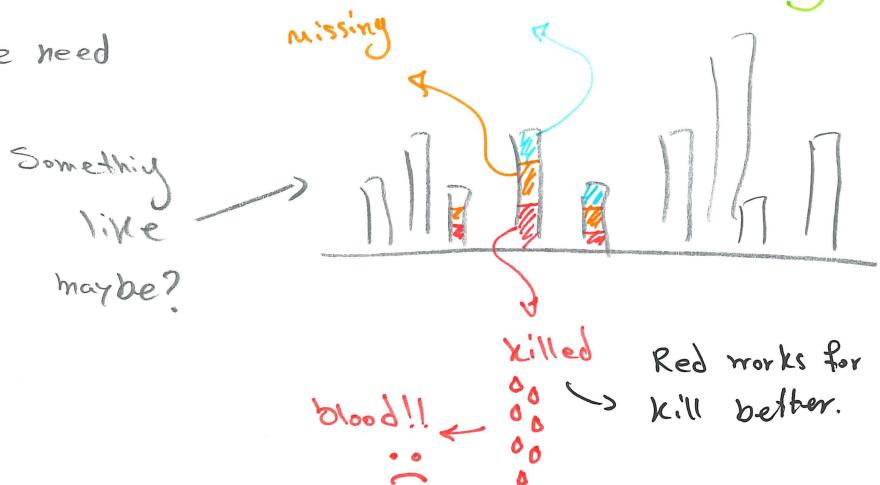

(Next Page)

3rd and 4th Attempt (cont.)

Solution

(lets adjust the colours as
red is better for kill and
orange for missing and blue for imprisoned which
shows some hope for journalist)
Imprisoned

To get which status we need
stacked bar chart

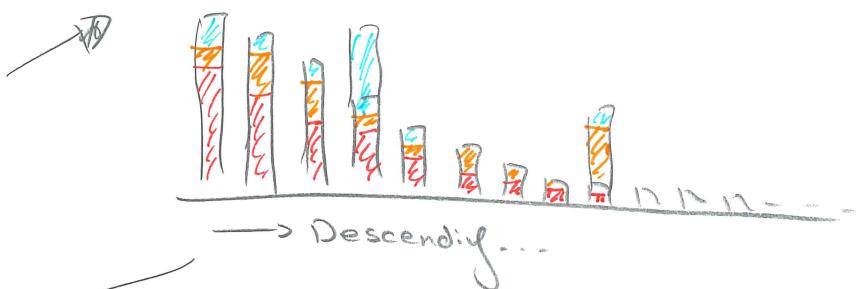

Bar chart looks much better!! but...

Still need to show top countries
in a better way!!

Maybe

Sorting the bar chart it self
instead of colours on the
map to show top countries?

Sort by: Killed
Red color

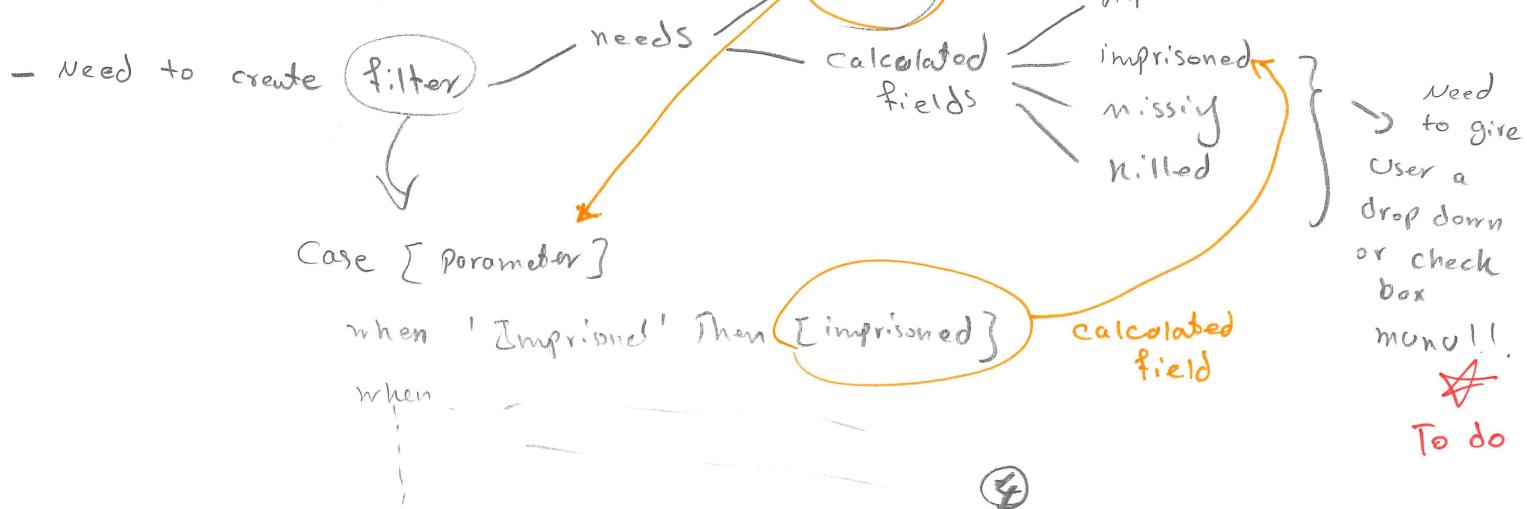

How to do

this? Can't get it done even

manually

- Need to create filter
